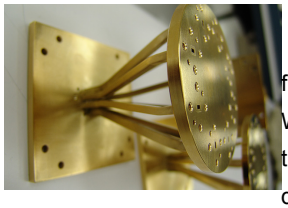
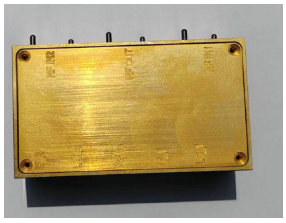
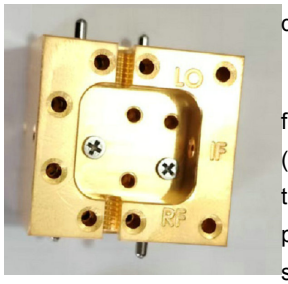
CNC PRECISION MACHINING OF MICROWAVE, MILLIMETERWAVE TO TERAHERTZ, SUBMILLIMETER COMPONENTS – BUILT TO YOUR DRAWINGS

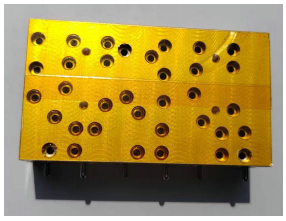
We are a dedicated manufacturer of microwave, millimeter-wave, sub-millimeter-wave, and terahertz structural components. We do not supply complete microwave, millimeter-wave, or sub-millimeter devices – we focus exclusively on precision machining of parts and structures according to customer drawings.





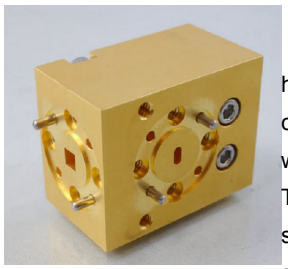
Our core competence covers the full RF spectrum from E-band, W-band, D-band, and beyond, including WR12 precision waveguides (straight, bends, twists, transitions, flexible, and rigid). We machine power distribution elements such as T-Y-junctions, attenuators, amplifiers, splitters, coaxial adapters, combiners, circulators, and dividers.

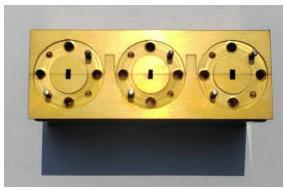




For frequency control and resonance, we produce frequency meters, mixers, resonance components (filters, couplers, resonant cavities, resonators, irises, tuning columns, and other RF devices). Our antenna portfolio includes pyramidal horns, sectoral horns, conical horns, corrugated horns, slot arrays, and leaky-wave antennas.

Every part is machined from customer-specified materials (aluminum, copper, brass, or coin silver) using high-speed milling, micro-EDM, and femtosecond laser finishing. We inspect with CMM and VNA up to THz frequencies. Send us your drawings – we deliver precision-machined structural components, not black boxes.





We also manufacture connection and interface hardware: flanges (plain and choke), shims, gaskets, covers, caps, dowel pins, seals, adapters, pressure windows, E-plane and H-plane tees, and magic tees. Testing and tuning components include sliding shorts, short circuits, fixed shorts, matched loads, terminations, attenuators, phase shifters, and calibration kits.

Special integrated structures are another strength: double-ridge and ridged waveguides, split-block housings, monobloc components, multi-layer assemblies, and complete waveguide housings. Our CNC custom precision machining covers intracavities, slot arrays, transitions, converters, switches, rotary joints, orthomode transducers (OMT), feed horns, isolators, diplexers, multipliers, phase shifters, detectors, and oscillators.
